What is Endodontic Therapy

Root canal, or endodontic therapy is performed when the pulp of the tooth has been damaged, usually by decay or physical trauma. Treatment consists of removing the pulp and cleaning, shaping, and sealing the root canal. The tooth remains alive, nourished by the adjacent tissues of the gum and jaw.

What is an Endodontist?

An endodontist is a dentist with advanced training in diagnosing and treating problems associated with the inside of a tooth. An additional 2 to 3 years of specialty training is completed after dental school. An endodontist performs routine and complex root canal procedures, along with retreatment of previously root canal treated teeth, and surgical procedures associated with the roots of teeth.

What is our goal?

We are committed to providing the highest standard of service in a relaxed, pleasant office utilizing our specially trained staff and state-of-the-art equipment. Our goal is to provide a treatment experience that is both comfortable and achieves a predictable result. While there is no certainty concerning healing, successful results occur in approximately 90% of cases. On occasion, surgical endodontic treatment in addition to non-surgical treatment may be required to restore your teeth to health and function.
